August 2013
Introduction

The accident statistics presented in this summary are confined to worldwide commercial jet airplanes that are heavier than 60,000 pounds maximum gross weight. Within that set of airplanes, there are two groups excluded:

1) Airplanes manufactured in the Commonwealth of Independent States (CIS) or the Union of Soviet Socialist Republics (USSR) are excluded because of the lack of operational data; and

2) Commercial airplanes operated in military service. (However, if a military-owned commercial jet transport is used for civilian commercial service, those data will be included in this summary.)

The following airplanes are included in the statistics:

<table>
<thead>

Flight operations data for Boeing airplanes are developed internally from airline operator reports. Flight operations data for non-Boeing airplanes are compiled from www.ascendworldwide.com, by Ascend. The source of jet airplane inventory data is Jet Information Services, Inc.

Accident data are obtained, when available, from government accident reports. Otherwise, information is from operators, manufacturers, various government and private information services, and press accounts.

Readers may note that cumulative accident totals from year to year may not exactly correlate with the expected change from the previous year’s accidents. This is a result of periodic audits of the entire accident history for updates to the data.

Definitions related to development of statistics in this summary are primarily based on corresponding International Civil Aviation Organization (ICAO), National Transportation Safety Board (NTSB), and Flight Safety Foundation (FSF) terms, as explained in the next section.
Definitions

**Airplane Accident:** An occurrence associated with the operation of an airplane that takes place between the time any person boards the airplane with the intention of flight and such time as all such persons have disembarked, in which:

- The airplane sustains substantial damage, or
- The airplane is missing or is completely inaccessible, or
- Death or serious injury results from:
  - Being in the airplane, or
  - Direct contact with the airplane or anything attached thereto, or
  - Direct exposure to jet blast.

**Excluding:**

- Fatal and nonfatal injuries from natural causes, and
- Fatal and nonfatal self-inflicted injuries or injuries inflicted by other persons, and
- Fatal and nonfatal injuries of stowaways hiding outside the areas normally available to the passengers and crew, and
- Nonfatal injuries resulting from atmospheric turbulence, normal maneuvering, loose objects, boarding, disembarking, evacuation, and maintenance and servicing, and
- Nonfatal injuries to persons not aboard the airplane.

The following occurrences are **not** considered airplane accidents – those that are the result of experimental test flights or the result of a hostile action, including sabotage, hijacking, terrorism, and military action.

*Note:* This is generally consistent with the ICAO and the NTSB definition of an accident (see the Referenced ICAO and NTSB Definitions section). The differences are:

1) The ICAO and NTSB references to “aircraft” were changed to “airplane” and references to propellers and rotors were eliminated, and

2) This publication excludes events that result in nonfatal injuries from atmospheric turbulence, normal maneuvering, etc.; nonfatal injuries to persons not aboard the airplane; and any events that result from an experimental test flight or from hostile action, such as sabotage, hijacking, terrorism, and military action.

*Note:* Within this publication, the term “accident” is used interchangeably with “airplane accident.”
Definitions (continued)

**Destroyed:** The estimated or likely cost of repairs would have exceeded 50 percent of the new value of the airplane had it still been in production at the time of the accident.

*Note:* This definition is consistent with the FSF definition. NTSB defines “destroyed” as damaged due to impact, fire, or in-flight failures to an extent not economically repairable.

**Fatal Injury:** Any injury that results in death within 30 days of the accident.

*Note 1:* This is consistent with both the ICAO and the NTSB definitions.

*Note 2:* External fatalities include on-ground fatalities as well as fatalities on other aircraft involved.

**Major Accident:** An accident in which any of three conditions is met:

- The airplane was destroyed, or
- There were multiple fatalities, or
- There was one fatality and the airplane was substantially damaged.

*Note:* This definition is consistent with the NTSB definition. It also is generally consistent with FSF, except that the FSF definition specifies that fatalities include only occupants of the airplane. ICAO does not normally define the term “major accident.”

**Serious Injury:** An injury that is sustained by a person in an accident and that:

- Requires hospitalization for more than 48 hours, commencing within seven days from the date the injury was received, or
- Results in a fracture of any bone (except simple fractures of fingers, toes, or nose), or
- Causes severe hemorrhage, nerve, muscle, or tendon damage, or
- Involves injury to any internal organ, or
- Involves second- or third-degree burns, or any burns affecting more than 5 percent of the body surface, or
- Involves verified exposure to infectious substances or injurious radiation.

*Note:* This is generally consistent with the ICAO definition. It is also consistent with the NTSB definition except for the last bullet item, which is not included in the NTSB definition.
Definitions (continued)

Substantial Damage: Damage or failure which adversely affects the structural strength, performance, or flight characteristics of the airplane, and which would normally require major repair or replacement of the affected component. Substantial damage is not considered to be:

- Engine failure or damage limited to an engine if only one engine fails or is damaged
- Bent fairings or cowlings
- Dents in the skin
- Small puncture holes in the skin
- Damage to wheels
- Damage to tires
- Damage to flaps
- Damage to engine accessories
- Damage to brakes
- Damage to wingtips

Note 1: This definition is generally consistent with the NTSB definition of substantial damage except: 1) It deletes reference to small puncture holes in the fabric and “ground damage to rotor or propeller blades”; and 2) It deletes “damage to landing gear” from the list of items not considered to be substantial damage.

Note 2: ICAO does not define the term “substantial damage”. Still, the above definition is generally consistent with the ICAO definition of damage or structural failure contained within part (b) of the ICAO accident definition.

Note 3: Boeing does not consider damage to be substantial if repairs to an event airplane enable it to be flown to a repair base within 48 hours of the event.
Boeing Terms

The terms on this page were created by Boeing for this publication and do not have corresponding equivalents in ICAO, NTSB, etc.

**Accident Rates:** In general, this expression is a measure of accidents per million departures. Departures (or flight cycles) are used as the basis for calculating rates, since there is a stronger statistical correlation between accidents and departures than there is between accidents and flight hours, or between accidents and the number of airplanes in service, or between accidents and passenger miles or freight miles. Airplane departures data are continually updated and revised as new information and estimating processes become available. These form the baseline for the measure of accident rates and, as a consequence, rates may vary between editions of this publication.

**Airplane Collisions:** Events involving two or more airplanes are counted as separate events, one for each airplane. For example, destruction of two airplanes in a collision is considered to be two separate accidents.

**Fatal Accident:** An accident that results in fatal injury.

**Hull Loss:** Airplane totally destroyed or damaged and not repaired. Hull loss also includes, but is not limited to, events in which:

- The airplane is missing; or
- The search for the wreckage has been terminated without it being located; or
- The airplane is completely inaccessible.

*Note: Neither ICAO nor NTSB has a definition for hull loss.*
Exclusions

Certain airplanes and events are excluded from consideration as accidents in this summary. This is a complete list of those exclusions.

Excluded Airplanes

Airplanes manufactured in the Commonwealth of Independent States (CIS) or the Union of Soviet Socialist Republics (USSR) are excluded because of the lack of operational data. Commercial airplanes operated in military service are also excluded. (However, if a military-owned commercial jet transport is used for civilian commercial service, those data are included in this summary.)

Excluded Events

- Fatal and nonfatal injuries from natural causes,
- Fatal and nonfatal self-inflicted injuries or injuries inflicted by other persons,
- Fatal and nonfatal injuries of stowaways hiding outside the areas normally available to the passengers and crew,
- Nonfatal injuries resulting from atmospheric turbulence, normal maneuvering, loose objects, boarding, disembarking, evacuation, and maintenance and servicing,
- Nonfatal injuries to persons not aboard the airplane,
- Experimental test flights (however, maintenance test flights, ferry, positioning, training, and demonstration flights are not excluded),
- Sabotage, hijacking, terrorism, and military action.
Referencing ICAO and NTSB Definitions

International Civil Aviation Organization (ICAO) and National Transportation Safety Board (NTSB) definitions are included below for reference.

Accident

ICAO defines an “accident” as follows:

**Accident.** An occurrence associated with the operation of an aircraft which, in the case of a manned aircraft, takes place between the time any person boards the aircraft with the intention of flight until such time as all such persons have disembarked, or in the case of an unmanned aircraft, takes place between the time the aircraft is ready to move with the purpose of flight until such time as it comes to rest at the end of the flight and the primary propulsion system is shut down, in which:

a) A person is fatally or seriously injured as a result of:
   • Being in the aircraft, or
   • Direct contact with any part of the aircraft, including parts which have become detached from the aircraft, or
   • Direct exposure to jet blast,
   except when the injuries are from natural causes, self-inflicted or inflicted by other persons, or when the injuries are to stowaways hiding outside the areas normally available to the passengers and crew; or

b) The aircraft sustains damage or structural failure which:
   • Adversely affects the structural strength, performance or flight characteristics of the aircraft, and
   • Would normally require major repair or replacement of the affected component,
   except for engine failure or damage, when the damage is limited to a single engine, (including its cowlings or accessories), to propellers, wing tips, antennas, probes, vanes, tires, brakes, wheels, fairings, panels, landing gear doors, windscreens, the aircraft skin (such as small dents or puncture holes), or for minor damages to main rotor blades, tail rotor blades, landing gear, and those resulting from hail or bird strike (including holes in the radome); or

c) The aircraft is missing or is completely inaccessible.

NTSB defines an “aircraft accident” as follows:

**Aircraft accident** means an occurrence associated with the operation of an aircraft which takes place between the time any person boards the aircraft with the intention of flight and all such persons have disembarked, and in which any person suffers death or serious injury, or in which the aircraft receives substantial damage. For purposes of this part, the definition of “aircraft accident” includes “unmanned aircraft accident,” as defined herein.
Referenced ICAO and NTSB Definitions (continued)

Serious Injury

ICAO defines “serious injury” as follows:

*Serious Injury.* An injury which is sustained by a person in an accident and which:

- Requires hospitalization for more than 48 hours, commencing within seven days from the date the injury was received; or
- Results in a fracture of any bone (except simple fractures of fingers, toes or nose); or
- Involves lacerations which cause severe hemorrhage, nerve, muscle, or tendon damage; or
- Involves injury to any internal organ; or
- Involves second or third degree burns, or any burns affecting more than 5 percent of the body surface; or
- Involves verified exposure to infectious substances or injurious radiation.

NTSB defines “serious injury” as follows:

*Serious injury* means any injury which:

1) Requires hospitalization for more than 48 hours, commencing within 7 days from the date the injury was received;
2) Results in a fracture of any bone (except simple fractures of fingers, toes, or nose);
3) Causes severe hemorrhages, nerve, muscle, or tendon damage;
4) Involves any internal organ; or
5) Involves second- or third-degree burns, or any burns affecting more than 5 percent of the body surface.

Substantial Damage

NTSB defines “substantial damage” as follows:

*Substantial damage* means damage or failure which adversely affects the structural strength, performance, or flight characteristics of the aircraft, and which would normally require major repair or replacement of the affected component. Engine failure or damage limited to an engine if only one engine fails or is damaged, bent fairings or cowlings, dented skin, small puncture holes in the skin or fabric, ground damage to rotor or propeller blades, and damage to landing gear, wheels, tires, flaps, engine accessories, brakes, or wingtips are not considered “substantial damage” for the purpose of this part.

ICAO does not define the term “substantial damage".

Accident Summary by Injury and Damage
All Accidents – Worldwide Commercial Jet Fleet

1959 Through 2012

- **608 Fatal Accidents** (33% of Total)
  - 495 fatal accidents with hull loss
    - 26 fatal accidents with substantial damage
    - 87 fatal accidents without substantial damage
  - 26 fatal accidents with substantial damage
  - 717 substantial damage without fatalities
  - 63 accidents without substantial damage (but with serious injuries)

- **1220 Nonfatal Accidents** (67% of Total)
  - 440 hull loss without fatalities
  - 108 hull loss without fatalities
  - 205 substantial damage without fatalities
  - 19 accidents without substantial damage (but with serious injuries)

Total 1828

2003 Through 2012

- **75 Fatal Accidents** (18% of Total)
  - 65 fatal accidents with hull loss
    - 2 fatal accidents with substantial damage
    - 8 fatal accidents without substantial damage

- **332 Nonfatal Accidents** (82% of Total)
  - 108 hull loss without fatalities
  - 205 substantial damage without fatalities
  - 19 accidents without substantial damage (but with serious injuries)

Total 407

- Onboard fatalities: 1, 8, 218, 471, 774, 111, 8, 17, 17
CAST/ICAO Common Taxonomy Team (CICTT) Aviation Occurrence Categories

The International Civil Aviation Organization (ICAO) and the Commercial Aviation Safety Team (CAST), which includes government officials and aviation industry leaders, have jointly chartered the CAST/ICAO Common Taxonomy Team (CICTT). CICTT includes experts from several air carriers, aircraft manufacturers, engine manufacturers, pilot associations, regulatory authorities, transportation safety boards, ICAO, and members from Canada, the European Union, France, Italy, the Netherlands, the United Kingdom, and the United States. CICTT is co-chaired by a representative from ICAO and CAST.

The team is charged with developing common taxonomies and definitions for aviation accident and incident reporting systems. Common taxonomies and definitions establish a standard industry language, thereby improving the quality of information and communication. With this common language, the aviation community’s capacity to focus on common safety issues is greatly enhanced.

The CICTT Aviation Occurrence Taxonomy is designed to permit the assignment of multiple categories as necessary to describe the accident or incident. Since 2001, the Safety Indicator Steering Group (SISG) has met annually to assign CICTT occurrence categories to the prior year’s accidents.

In a separate activity, the CAST assigned each fatal accident to a single principal category. Those accident assignments and a brief description of the categories are reported in the following chart.

The CAST use of principal categories has been instrumental in focusing industry and government efforts and resources on accident prevention. Charts using principal categories are used by CAST to identify changes to historic risk and to help to determine if the safety enhancements put in place are effective.

For a complete description of the categories go to: http://www.intlaviationstandards.org/
Fatalities by CAST/ICAO Common Taxonomy Team (CICTT) Aviation Occurrence Categories

No fatal accidents were noted in the following principal categories:
- ADRM Aerodrome
- AMAN Abrupt Maneuver
- ATM Air Traffic Management/Communications, Navigation, Surveillance
- BIRD Bird
- CABIN Cabin Safety Events
- CTOL Collision with obstacle(s) during takeoff and landing
- EVAC Evacuation
- EXTL External load related occurrences
- F-POST Fire/Smoke (Post-Impact)
- FUEL Fuel Related
- GCOL Ground Collision
- ICE Icing
- LALT Low Altitude Operations
- LOC-G Loss of Control – Ground
- RI-A Runway Incursion – Animal
- RI-VAP Runway Incursion – Vehicle, Aircraft or Person
- SCF-NP System/Component Failure or Malfunction (Non-Powerplant)
- SEC Security Related
- TURB Turbulence Encounter
- WILD Wildlife

Note: Principal categories as assigned by CAST.
For a complete description of CICTT Aviation Occurrence Categories, go to: http://www.intlaviationstandards.org/
This edition is dedicated to our friend and co-worker, Randy Elliott. Randy was instrumental in the production of this document for many years. He is and will be fondly remembered and sorely missed.
